# BERGMAN SPACES FOR THE SOLUTIONS OF LINEAR PARTIAL DIFFERENTIAL EQUATIONS 

by

Maher M.H. MARZUQ
§1. Introduction. The operator Re (taking the real part of a complex function in one complex variable) transforms the class of analytic functions into the class of harmonic functions. Since harmonic functions are the solutions of Laplace's equation, it is natural to ask whether similar possibilities exist for relating solutions of more general partial differential equations to holomorphic functions. Bergman [1] established various integral operators which associate the solutions of linear elliptic partial differential equations in two real variables with holomorphic functions of one complex variable.

Let $L(U)$ be a second linear partial differential equation given by

$$
\begin{equation*}
L(U)=U_{x x}+U_{y y}+a(x, y) U_{x}+b(x, y) U_{y}+c(x, y) U=0 \tag{1.1}
\end{equation*}
$$

where $a, b, c$ are real analytic functions in a domain $D \subset \mathbb{R}^{2}$. Now,
continue $a, b, c$ into entire functions in $\mathbb{1}^{2}$. Consider the following transformations of $\mathbb{C}^{2}$ into itself:

$$
\begin{aligned}
z & =x+i y \\
z^{*} & =x \text {-iy }
\end{aligned} \quad(x, y) \in \mathbb{C}^{2}
$$

( $z, z^{*}$ are complex conjugates if and only if $x, y$ are real). Then (1.1) becomes

$$
\begin{equation*}
\mathrm{L}(\mathrm{U})=\mathrm{U}_{\mathrm{Zz}} *+\mathrm{AU}_{\mathrm{z}}+\mathrm{BU}_{\mathrm{z}^{*}}+\mathrm{CU}=0, \tag{1.2}
\end{equation*}
$$

where $B=\bar{A}, U\left(z, z^{*}\right)=U(x, y)$ and $A, B, C$ are entire functions in two complex variables $[1, \mathrm{p} .6]$. It is known that

$$
U\left(z, z^{*}\right)=c_{2}\left(z, z^{*}, g\right)
$$

is a solution of (1.2), where $c_{2}$ is the Bergman $c_{2}$-integral operator and $g$ is a given holomorphic function in one complex variable $z[1, p .13]$. Solutions of equation (1.2) can be written as an infinite series:
$u\left(z, z^{*}\right)=c_{2}(g)$
$=\exp \left[-\int_{0}^{z^{*}} A\left(z, \zeta^{*}\right) d \zeta^{*}\right]\left[g(z)+\sum_{n=1}^{\infty} \frac{Q^{(n)}\left(z, z^{*}\right)}{2^{2 n} B(n, n+1)} \int_{0}^{z}(z-\zeta)^{n-1} g(\zeta) d \zeta\right]$.
Here

$$
\begin{equation*}
Q^{(n)}\left(z, z^{*}\right)=\int_{0}^{z^{*}} \mathrm{P}^{(2 n)}\left(z, z^{*}\right) \mathrm{d} z^{*} \tag{1.3}
\end{equation*}
$$

where $P^{(2 n)}$ are holomorphic functions satisfying certan recursion relations $[1, \mathrm{p} .15$, Equation 5]. Also, it is assumed that $g(0)=0$, and $B(n, n+1)$ is a beta function.

In the rest of the paper $D, E$ and $F$ are positive constants which depend on the indicated parameters only and not on any
function which may appear in a particular formula. The constants are not necessarily the same on any two occurrences.
§2. Bergman spaces for solution of linear partial differential equations. Let $\Delta^{N}$ denote the unit polydisc with center at the origin, and $T^{N}=\left\{w \in \mathbb{T}^{N}:\left|w_{j}\right|=1,1 \leqslant j\right.$ $\leqslant N\}$ be the Bergman-Silov boundary. For $z \in \mathbb{C}^{N}$, let $d z=d z_{1}$ $\ldots d z_{n}$ and for $w \in T^{N}, w_{j}=\exp \left(i \theta_{j}\right)$, let $d m_{N}(w)=(2 \pi)^{-N} d \theta_{1} \ldots$ $\mathrm{d} \theta_{N}$. Given $r=\left(r_{1}, \ldots, r_{N}\right)$ and $z \in \mathbb{R}^{N}$, denote by $r_{z}$ the $N$-tuple $\left(r_{1} z_{1}, \ldots, r_{N} z_{N}\right)$. A function $f$, holomorphic on $\Delta^{N}$, is said to be in $H^{\mathrm{P}}\left(\Delta^{\mathrm{N}}\right), 0<\mathrm{p}<\infty$, if

$$
M_{p}(r, f)=\left(\int_{T N}|f(r w)|^{P_{d m}}(w)\right)^{1 / P}
$$

is bounded independently of $r$ for all $r \in I^{N}=[0,1) \times \ldots \times[0,1)$. The funtion $f$ is said to be in the Bergman space $A^{P}\left(\Delta^{N}\right)(0<p$ $<\infty$ ), if

$$
\|f\|_{A} P\left(\Delta^{N}\right)=\left(\int_{0}^{1} r_{N} d r_{N} \int_{0}^{1} \ldots \int_{0}^{1} M_{p}^{P}(r, f) r_{1} d r_{1}\right)^{1 / P}<\infty
$$

Yang [4, Theorem 5.1, p.96] proved that the Bergman $c_{2}$-integral operator preserves the $H^{\mathrm{P}}$ property, i.e. the $\mathrm{c}_{2}$-operator maps $H^{P}\left(\Delta^{1}\right)$ into $H^{P}\left(\Delta^{2}\right)$ for ( $1 \leqslant p<\infty$ ).

We extend Tang's result and prove:

THEOREM. For $1 \leqslant p<\infty$ if $g \in A^{P}\left(\Delta^{1}\right)$, then $c_{2}(g)=$ $U\left(z, z^{*}\right) \in A^{P}\left(\Delta^{2}\right)$, where $c_{2}$ is the integral operator given by (1.3).

Proof. First assume $g(0)=0$. Then $U\left(z, z^{*}\right)$ is given by
(1.3). Since $A\left(z, \zeta^{*}\right)$ is an entire in $\mathbb{\mathbb { L }}^{2}$, it is bounded in $\Delta^{2}$, so that

$$
\begin{equation*}
\left|\exp \left(-\int_{0}^{z^{*}} \mathrm{~A}\left(z, \zeta^{*}\right) \mathrm{d} \zeta^{*}\right)\right| \leqslant \mathrm{D} \tag{2.1}
\end{equation*}
$$

Let $z=r_{1} e^{i \theta_{1}}, z^{*}=r_{2} e^{i \theta_{2}}, \zeta=s e^{i \theta_{1}}$. Then by (2.1) and (3.1),

$$
\begin{aligned}
\left|U\left(r_{1} e^{i \theta_{1}}, r_{2} e^{i \theta_{2}}\right)\right| & \leqslant D\left[\left|g\left(r_{1} e^{i \theta_{1}}\right)\right|+\right. \\
& \left.+\sum_{n=1}^{\infty} H_{n}\left(z, z^{*}\right) \int_{0}^{|z|}|z-\zeta|^{n-1}\left|g\left(s e^{i \theta_{1}}\right)\right| d s\right]
\end{aligned}
$$

where

$$
H_{n}\left(z, z^{*}\right)=\frac{Q^{(n)}\left(z, z^{*}\right)}{2^{2 n_{B(n, n+1)}}}
$$

Now $|z-\zeta|<r_{1}<1$, so that
$\left|U\left(r_{1} e^{i \theta_{1}}, r_{2} e^{i \theta_{2}}\right)\right| \leqslant D\left[\lg \left(r_{1} e^{i \theta_{1}}\right)+\sum_{n=1}^{\infty} H_{n}\left(z, z^{*}\right) \int_{0}^{r_{1}}\left|g\left(s e^{i \theta_{1}}\right)\right| d s\right]$.
It can be shown that $\sum_{n=1}^{\infty} H_{n}\left(z, z^{*}\right)$ is an entire function in $\mathbb{C}^{2}$, [4], therefore it is $n=1 \mathrm{n}$ bounded in $\Delta^{2}$ and

$$
\left|U\left(r_{1} e^{i \theta_{1}}, r_{2} e^{i \theta_{2}}\right)\right| \leqslant D\left[\left|g\left(r_{1} e^{i \theta_{1}}\right)\right|+E \int_{0}^{r_{1}}\left|g\left(s e^{i \theta_{1}}\right)\right| d s\right]
$$

Since

$$
\begin{equation*}
(a+b)^{P} \leqslant 2^{P}\left(a^{P}+b^{P}\right), \quad a \geqslant 0, b \geqslant 0 \text { for } 0<p<\infty, \tag{2.2}
\end{equation*}
$$

[2], then

$$
\left|U\left(r_{1} e^{i \theta_{1}}, r_{2} e^{i \theta_{2}}\right)\right|^{p} \leqslant D_{p}\left[\left|g\left(r_{1} e^{i \theta_{1}}\right)\right|^{p}+E^{p}\left(\int_{0}^{r_{1}}\left|g\left(s e^{i \theta_{1}}\right)\right| d s\right)^{p}\right] .
$$

Integrate with respect to $\theta_{1}, \theta_{2}$ over $[0,2 \pi] \times[0,2 \pi]$, then take
the $p^{\text {th }}$ root of both sides and use (2.2). This gives

$$
\begin{aligned}
& \left(\int_{T^{2}}\left|U\left(r_{1} e^{i \theta_{1}}, r_{2} e^{i \theta_{2}}\right)\right|^{P_{d}} d \theta_{1} d \theta_{2}\right)^{1 / P} \\
\leqslant & D_{p}\left[\left(\int_{0}^{2 \pi}\left|g\left(r_{1} e^{i \theta_{1}}\right)\right|^{P} d \theta_{1}\right)^{1 / P}+E\left(\int_{0}^{2 \pi}\left(\int_{0}^{r_{1}}\left|g\left(s e^{i \theta_{1}}\right)\right| d s\right)^{P} d \theta_{1}\right)^{1 / p}\right] .
\end{aligned}
$$

Using Minkowski's inequality in continuous form on the second term of the right side, we obtain

$$
\begin{aligned}
& \left(\int_{T^{2}}\left|U\left(r_{1} e^{i \theta_{1}}, r_{2} e^{i \theta_{2}}\right)\right|^{P} d \theta_{1} d \theta_{2}\right)^{1 / p} \\
\leqslant & D_{p}\left[\left(\int_{0}^{2 \pi} \mid g\left(r_{1} e^{i \theta_{1}}\right) P^{P} d \theta_{1}\right)^{1 / p}+E \int_{0}^{r_{1}}\left(\int_{0}^{2 \pi} \mid g\left(s e^{i \theta_{1}}\right) P^{p} d \theta_{1}\right)^{1 / p_{d s}}\right] .
\end{aligned}
$$

Since the mean of $g$ is monotone nondecreasing, we have

$$
\left(\int_{T^{2}}\left|U\left(r_{1} e^{i \theta_{1}}, r_{2} e^{i \theta_{2}}\right)\right|^{p_{d}} \theta_{1} d \theta_{2}\right)^{1 / p} \leqslant D_{p}\left(\int_{0}^{2 \pi}\left|g\left(r_{1} e^{i \theta_{1}}\right)\right|^{p_{d \theta}}\right)^{1 / p}
$$

Now, raising both sides to the $p^{\text {th }}$ power, multiplying by $r_{1}, r_{2}$ and integrating with respect to $r_{1}, r_{2}$ over $[0,1] \times[0,1]$, we obtain

$$
\begin{equation*}
\|U\|_{A} P\left(\Delta^{2}\right) \leqslant D_{P}\|g\|_{A} P\left(\Delta^{1}\right) . \tag{2.3}
\end{equation*}
$$

Secondly, suppose that $g(0)=a \neq 0$. Set $G(z)=g(z)-a$. Then $c_{2}(g)=c_{2}(G)+c_{2}(a)$, since $c_{2}$ is a linear operator, where

$$
c_{2}(a)=\exp \left[-\int_{0}^{z^{*}} A\left(z, \zeta^{*}\right) d \zeta^{*}\right]\left[a+a \sum_{n=1}^{\infty} h_{n}\left(z, z^{*}\right)\right]
$$

and

$$
h_{n}\left(z, z^{*}\right)=\frac{Q^{(n)}\left(z, z^{*}\right) z^{n}}{2^{2 n_{B}(n, n+1)}} .
$$

But $h=\sum_{n=1}^{\infty} h_{n}$ converges uniformly in every compact subset of $\mathbb{I}^{2},[4$, Lemma $5.1, \mathrm{p} .94]$; therefore, $h$ is an entire function in $\mathbb{C}^{2}$. Thus, for $\left(z, z^{*}\right) \in \Delta^{2}$,

$$
|h| \leqslant F .
$$

Hence by using (2.1) we get

$$
\begin{equation*}
\left|c_{2}(a)\right| \leqslant D|a|[1+D] . \tag{2.4}
\end{equation*}
$$

But for $g \in A^{P}(\Delta) \quad(p>0)$, we have

$$
|g(z)| \leqslant \frac{\|g\|_{A P}(\Delta)}{\left(1-|z|^{2}\right)^{2 / P}}, \quad|z|<1
$$

[3,p. 476 Equation 17] and in particular for $z=0$

$$
\begin{equation*}
|a|=|g(0)| \leqslant\|g\|_{A P(\Delta)}, \tag{2.5}
\end{equation*}
$$

so that (2.4) and (2.5) give

$$
\begin{equation*}
\left|c_{2}(a)\right| \leqslant D\|g\|_{A P(\Delta)} . \tag{2.6}
\end{equation*}
$$

Thus (2.3) and (2.6) give the theorem.

COROLILARY. If $g \in A^{p}\left(\Delta^{1}\right), 1 \leqslant p<\infty$, then the $c_{2}$-operator is a bounded linear transformation from $A^{P}\left(\Delta^{1}\right)$ to $A^{P}\left(\Delta^{2}\right)$.

Proof. From the proof of the theorem, there exists a constant $D$ depending on $p$ only such that

$$
\|U\|_{A P\left(\Delta^{2}\right)} \leqslant D_{p}\|g\|_{A} P\left(\Delta^{1}\right) .
$$
